ABSTRACT

This report provides statistical data concerning advanced degree output and productivity in the South 1965-66 and 1968-69. Two kinds of information are presented: (1) tabulations of all advanced degrees and degree-producing programs by field, state, and institutional control, reported for the SREB (Southern Regional Education Board), and (2) selected regional indicators of output and productivity for each field, with comparisons. (MJM)

FOREWORD

Regional education, as conceived by the founders of the Southern Regional Education Board, is education organized to serve needs of the entire region at minimum cost. For SREB this has sometimes meant promoting expansion, particularly of undeveloped programs, sometimes sharing in existing programs, and sometimes exercising constraints on new program growth.

Graduate and professional education have been a subject of SREB's attention from the outset. The South, with one third of the nation's population, was producing only a twelfth of the nation's doctorates at its universities in 1950. In 1970 those universities, along with others which had in the meantime developed doctoral programs, were producing a fifth of the nation's doctorates. This is an accomplishment of which the region may justly be proud.

The seller's market for Ph.D's which characterized the manpower scene in the 1950's is replaced, in many fields, by the buyer's market of the 1970's. The nature of the Board's concerns in behalf of graduate education are correspondingly affected. The South must not cease development of its higher educational programs, but it is quite apparent that expansion of programs, especially in expensive fields, must proceed with utmost regard to future demand for specific degrees and to projected outputs of degrees.

The present report only scratches the surface in terms of data required on a continuing basis for graduate program planning. By mapping out the regional and national context for more detailed analysis at the local level, these data can add significantly to our understanding of the prospects both for increased educational economies and for enhanced educational effectiveness through institutional, statewide and regional cooperation in graduate education.

Winfred L. Godwin
President

INTRODUCTION

Background

Academic output and productivity has recently become a subject of increasing attention. Mounting financial stringencies besetting higher education have sparked interest in high instructional costs, particularly of graduate education. The downward turn in demand for the graduates of many academic programs has focused attention on output of degrees.

As a consequence, institutions of all kinds are taking stock of their offerings. Prestigious graduate institutions have recently eliminated certain graduate programs which were not readily justifiable from an economic standpoint. In the public sector, state higher education agencies have turned to graduate degree production inventories as a basis for adjustments in future program planning, often in close consultation with the institutions.

Some state agencies are issuing purely descriptive annual inventories of degrees granted. Others publish annual production statistics over a series of years, to facilitate the identification of under-productive programs. Sometimes refinements are included showing, for example, students enrolled at each level or the number of student credit hours produced within a field. Cost information for each program is offered in a few state studies.

While each state needs to approach the subject in terms of its own needs, the value of state studies is enhanced where the data permit comparative analyses. States follow various levels of specificity in delimiting what constitutes a program. To the extent that the reporting procedures of the U. S. Office of Education, as developed for the Higher Education General Information Surveys (HEGIS), are followed, state, regional and national comparisons are facilitated. The present report provides a limited analysis of HEGIS data for the states embraced by the Southern Regional Education Board.

Related reports published by SREB are Doctoral Programs Offered by Southern Universities, 1955; Academic Degrees Awarded in the Southern States, 1963-64, 1965;

and Uncommon Programs in Southern Colleges and Universities, Degrees Awarded in 1963-64, 1966. The first of these provided for each field the number of doctorates awarded over the six-year period 1949-1954 by each institution located in the SREB states. It was meant "to help [institutions] publicize their doctoral programs and aid them in planning their own programs in relation to those of other institutions." By 1965 and 1966 the large-scale expansion of Southern graduate education had advanced to a stage where "publicizing of doctoral programs" was no longer deemed necessary. The SREB reports published during those years, based on U. S. Office of Education data and without institutional identification, were presented primarily "as an aid to curriculum planning and interinstitutional cooperation." A regional summary was provided in the 1965 report to show how regional production related to national production.

The current report again is aimed at curriculum planning and interinstitutional cooperation; assessment of output and productivity is given increased attention by the addition of several "productivity indicators" and an arrangement by fields instead of by state in order to facilitate state and regional comparisons within academic disciplines.

Description of Data

Reports of degrees awarded, the basic unit of academic production, are collected annually by HEGIS. The present report is confined to data on degrees awarded in 1966 and 1969, thus showing the production trend at the close of the last decade. During this three year period master's degrees produced in the region increased 51%, from 24,445 to 36,848. The total of doctorates rose 56%, from 3,008 to 4,699.

In addition to the number of degrees produced in a given field, by state and institutional control, Table 1 (pp. 1-231) indicates the number of degree-producing programs in each category. For the region and nation, the number of degrees per program is also shown in each field as a rough measure of productivity. Regional shares, both of degrees and of degree-producing programs, are presented as a device for gauging the regional contribution to national production for each field of study. Finally, ratios of master's to doctoral degrees in each field are indicated to assist in

evaluation of balance between outputs at the respective levels. These regional "measures of productivity" are listed separately in Table 2 (pp. 233-244) and summarized for the 27 major HEGIS categories in Tables 3 and 4 (pp. 245-246). Tables 3 and 4 also express degrees per program in the region as a percent of degrees per program in the nation for convenience in making rough comparisons.

Thus the report contains two kinds of information, (1) tabulations of all advanced degrees and degree-producing programs by field, state, and institutional control, reported for the SREB states during 1965-66 and 1968-69 and (2) selected regional indicators of output and of productivity for each field, with United States comparisons.

The state tabulations provide a descriptive framework within which to relate the contributions of the public and private sectors in each state to the total output of any advanced field of study. It must be borne in mind that newly emerging programs are not visible until the award of degrees, and even well-established programs do not necessarily award degrees in every year.

The measures of production and productivity are offered as a tool to assist in future planning of graduate education at institutional, state and regional levels.

One assessment of production is in terms of regional shares, a rough yardstick of "normal" production being the region's share of college enrollment at all levels, which is 25 percent of national enrollments. During the three-year span which is covered, the South accounted for about 25 percent of master's level programs and produced about 18 percent of master's degrees. It accounted for about 21 percent of doctoral programs and for 18 percent of doctoral degrees. This translates into a productivity of 10 to 12 master's degrees per degree-producing program, compared with a national productivity of 14 to 16 degrees per program. It means 5 doctoral degrees per program compared with 6 at the national level. Both regionally and nationally, the ratio of master's to doctor's degrees is about 8 to 1.

The average number of degrees per program varies from state to state, largely as the general magnitude of graduate education varies, ranging at the doctoral level from 2.6

degrees per program in West Virginia to 5.9 in Texas. This compares with a regional average of 4.8 and a national average of 5.9 degrees per program. In 1969 there were 29 fields in which the South exceeded the nation in degrees per doctoral program, 10 fields in which regional productivity equalled the nation's and 112 in which the region was below the nation.

The numbers involved in advanced degree production are too small to provide stable statistical indicators on a continuous annual basis by individual field, even at the regional level. It may, however, be useful to offer a frame of reference for approaching the data through a scheme of broad classifications. Output potential of the 19 major field categories in 1969 ranged from a 15.1 percent share of U. S. doctoral programs in the fine and applied arts to a 29.1 percent share of programs in the agricultural sciences, (Table 3, page 245). Productivity ranged from a "degree per program" level 52.3 percent of the U. S. average in the fine and applied arts to 116.1 percent of the U. S. average in religion. The average of all major fields was 81.4 percent of U. S. productivity, with two fields at or above the U. S. level and 17 fields below.

These regional output and productivity ranges suggest four groupings:

(1) Fields in which the South has a relatively low share of programs, but of relatively high productivity. Forestry is in this category at the doctoral level. These fields would appear in the least immediate danger of becoming overexpanded.

(2) Fields in which the South has a high share of programs, which are of relatively high productivity. At the doctoral level, home economics is a case in point. In a time of declining national demand, some of these fields might be subject to saturation.

(3) Fields in which the South has a low share of programs, which are also of relatively low productivity. The doctorate in fine and applied arts typifies this situation. These fields are less secure from the standpoint of productivity but would have room for expansion, given an adequate national market for their outputs.

(4) Fields in which the South has a high share of programs, which are of relatively low productivity. Doctoral programs in psychology may serve as an example. In a shrinking national market for degrees, this is the most vulnerable of the four output and productivity conditions.

Illustrative Applications

A major purpose in presentation of these tables is to provide one kind of guidelines or norms to statewide planning in specific fields and in specific institutions. The agricultural fields, the first listing, may serve to illustrate possible applications.

The regional share of the nation's doctoral level, degree-producing programs in agriculture moved from 24.3 percent in 1966 to 29.1 in 1969 (Page 1). Degrees produced rose correspondingly from 17.9 percent to 23.5 percent, suggesting a regional increase in productivity. This is borne out by the number of degrees per program, which rose from 2.8 to 3.2 in the region and compares with a national output of 4.0 degrees per doctoral program in agriculture.

The region accounts for 35.2 percent of master's programs in agriculture and produces 28.8 percent of master's degrees, resulting in a somewhat larger ratio of master's degrees to doctorates (3.45 to 1) than obtains for the nation (2.81 to 1).

Continuing the examination of advanced degree outputs in agriculture, it is noted that 12 specific fields appear at the doctoral level. The first listing is "agronomy and field crops" (Page 3). Regional programs in agronomy and field crops at the doctoral level accounted for 36 percent of the national total in 1969. However doctoral degrees, which were 20.4 percent of the nation's production in 1966, had dropped to 16.5 percent by 1969. Degrees per program did not decline but rose from 2.4 in 1966 to 2.9 in 1969. Therefore the decline in share of national production must have been relative; output nationally in fact rose during these years--from 4.2 degrees per program in 1966 to 6.3 in 1969.

Productivity in agronomy and field crops, measured in degrees per program, thus lags considerably behind the

nation at the doctoral level. The difference in mixture of advanced degree levels which was noted for agriculture as a whole also holds for agronomy and field crops--2.77 master's to 1 doctoral degree in the region compared with 1.78 to 1 in the nation.

The tabulation of programs and degrees in agronomy and field crops reveals one degree-producing program at a publicly-controlled institution in each of nine states both in 1966 and 1969. Meanwhile, the degrees granted by the agronomy and field crops degree-producing programs reported for the United States as a whole rose from 108 to 158. Degrees per program, outside the South, rose from 5.1 in 1966 to 8.3 in 1969. Corresponding rates of production by programs in the South are 2.4 and 2.9 for these years.

Inquiry at the institutional level would be necessary to pursue the complete meaning of these summary measures. The published USOE report on degrees granted in 1968-69, in fact, provides data revealing that six non-Southern institutions, with annual outputs of 10 to 20 doctorates in agronomy and field crops, accounted for 56 percent of the U. S. output in 1969. Nineteen others, half of them in the South, produced the other 44 percent, with annual outputs of 1 to 8 degrees per program.

Turning for an additional illustrative example to just one other part of the curricular spectrum--Latin and classical Greek (classics)--several contrasts to the situation in the agriculture fields may be noted. At the doctoral level, three Southern degree-producing programs in classics produced de-degrees during the years reported (Page 128). Regional share of programs was 8.7 and 11.5 percent of the national total during these two years. Regional share of degrees produced moved from 6.3 percent to 23.1 percent, reflecting a shift in productivity from 2 degrees per program to 6 per program, against a national average of 3 per program.

With as small a number of doctoral degree-producing programs as obtains in classics, production could of course be expected to be erratic. One classics program is reported at a private institution; it produced 2 doctoral degrees in 1966 and 10 in 1969. The two programs in the public sector between them produced 2 degrees in 1966 and 8 in 1969. At the master's level, a total of 5 programs in 1966 and 15

in 1969 produced 21 and 47 degrees respectively during those two years.

For a bird's eye picture of output and productivity comparisons at the regional level for other fields, attention is called to the three summary tables on pp. 233-246.

Illustrative Implications

Further analysis of regional needs for graduate study in the illustrative fields both of classics and of agronomy and field crops would require close attention to supply and particularly to demand data in these fields. Moreover, the need for academic cost analyses by the institutions, states and constituencies which support these programs would be central to any extended analysis.

Finally, the possibility of cooperative arrangements enabling states and institutions to pool resources for advanced study is bound to be raised. If it were determined, for example, that several institutions were operating a number of expensive programs in a given field, each with little prospect of growing significantly beyond their current low levels of productivity, would it be feasible to divide responsibility for doctoral programs according to mutually agreeable interinstitutional plans?

The discipline of classics presents a case of an uncommon speciality with limited demand. Traditionally identified with strength in the private sector, at least in the South it is also established in certain publicly supported institutions. Agronomy and field crops, by contrast, is a field of great economic importance which is widely dispersed within the public sector. If fields in the agricultural sciences prove overextended, this may largely be the result of the ebb and flow in public funds at the federal level.

The field of classics is an instance where existing strengths at one of several departments might be built upon to provide a regional center concentrating on doctoral production, given sufficient incentive by states or agencies interested in supporting a regional program in classics. While such an impetus has not appeared, it could conceivably develop. Agronomy and field crops is a field in which the logic of a regional program can be demonstrated on a much larger scale; identification of a regional center in an

agricultural science would be difficult, however, given the relatively large number of programs potentially available for this function. On the other hand, states might be more inclined to support a cooperative effort in agriculture, given the economic importance of the field.

Pressures to justify programs of apparently low productivity will in all probability increase across the entire range of disciplines. Related combinations of disciplines such as the agricultural sciences may then enjoy the peculiarly favorable circumstance of wide potential for regional trade-offs between institutions--University A assuming responsitility for doctoral programs in agronomy and field crops, University B emphasizing poultry science, etc. Regional cooperation, one of the tools available to higher educational planning as a method of maximizing the utilization of available resources in professional fields, still remains to be tested as a response to problems of allocation in graduate education during the decelerating period of graduate education growth in the 1970's.
